

Ex 11.3
p 350

Person on ladder.

a, Find N_w, N_G, F_s

FBD for ladder:

Static equilibrium in x & y : $\Sigma F = 0$

$$x: \Sigma F_x = 0 = F_s - N_w \rightarrow F_s = N_w$$

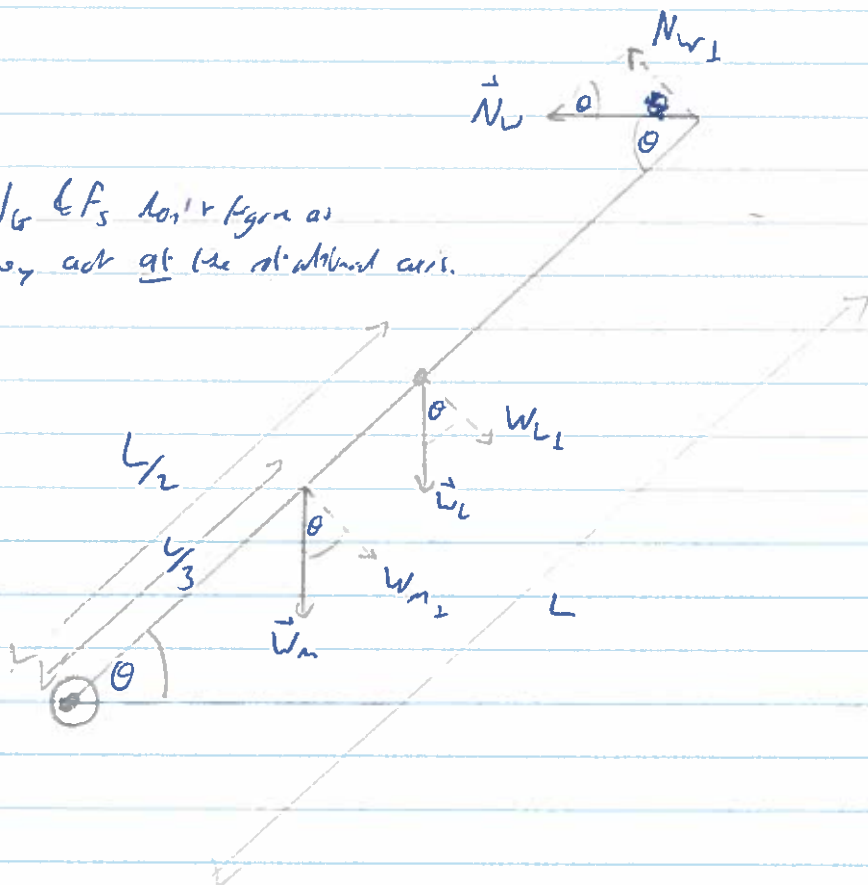

$$y: \Sigma F_y = 0 = N_g - W_L - W_m \rightarrow N_g = W_L + W_m$$

$$W_L = 180\text{ N}, W_m = 800\text{ N}$$

$$\underline{N_g} = 180\text{ N} + 800\text{ N} = \underline{980\text{ N}}$$

Rotational diagram around base of ladder.

N_g & F_s don't figure as
they act at the rotational axis.

Rot. equil:

$$\sum \tau = 0 = \tau_m + \tau_L + \tau_v$$

Torques: $\tau_m = -\frac{L}{3} W_m = -\frac{L}{3} W_m \cos \theta$

$$\tau_L = -\frac{L}{2} W_L = -\frac{L}{2} W_L \cos \theta$$

$$\tau_v = +L N_v = +L N_v \sin \theta$$

$$\sum \tau = 0 = -\frac{L}{3} W_m \cos \theta - \frac{L}{2} W_L \cos \theta + L N_v \sin \theta$$

$$N_v = \frac{\frac{1}{3} W_m + \frac{1}{2} W_L}{\tan \theta}$$

$$= \frac{\frac{1}{3} (800 \text{ N}) + \frac{1}{2} (180 \text{ N})}{\tan 53.1^\circ}$$

$$\underline{N_v = 267.8 \text{ N}}$$

From static equil in x: $\underline{F_s = N_v = 267.8 \text{ N}}$

b) $F_s = \mu_s N_v$ $\mu_s = \frac{F_s}{N_v} = \frac{267.8 \text{ N}}{980 \text{ N}}$

$$\underline{\mu_s = 0.273}$$
